Customer Journey Map

Date: 28 October 2026	**Team ID:** Individual Project
Project Name: Health360_HealthCare_Analysis	**Maximum Marks:** 2 Marks

Customer Journey Map Overview:

Map out the customer's experience stage-by-stage, capturing their actions, touchpoints, thoughts, and feelings, along with process ownership and improvement opportunities at each stage. This journey maps how healthcare professionals (Dr. Michael Carter, Emily Rodriguez, Dr. Priya Nair) transition from manual data inspection to interactive Tableau healthcare analytics.

Phase of Journey	Stage 1: Problem Identification & Data Collection	Stage 2: Diagnostic & Behavioral Analytics (Tableau)	Stage 3: Decision Support & Preventive Strategy Implementation
Actions **What does the customer do?**	Gathers 5,000 patient records containing clinical indicators (BMI, BP, Glucose, Cholesterol) and lifestyle metrics (Smoking, Alcohol, Exercise, Fatigue). Attempts manual spreadsheet filtering.	Builds and interacts with Tableau dashboards; filters patients across Age Groups & BMI Categories; analyzes Blood Pressure vs. Glucose scatter plots and Smoking/Exercise distributions.	Identifies high-risk patient cohorts, shares visual findings with clinical teams and public health administrators, and designs targeted preventive care programs.
Touchpoint **What part of the service do they interact with?**	Raw EHR / EMR database exports, static Excel spreadsheets, and baseline clinical diagnostic logs.	Tableau Public Interactive Dashboard, KPI Metric Cards (Diabetes, Heart Disease, Stroke rates), Scatter Plot Matrix, and Heatmaps.	Tableau Visual Story Presentation, Executive Risk Reports, and Public Health Policy Planning Sessions.
Customer Thought **What is the customer thinking?**	"Manual analysis of patient records is too slow; delayed detection of Diabetes, Heart Disease, and Stroke will lead to severe complications and higher treatment costs."	"The Tableau dashboard clearly highlights high-risk outliers! Seeing glucose spikes alongside obesity and smoking habits makes risk stratification instant."	"We now have actionable visual proof to prioritize high-risk patients, optimize clinical interventions, and allocate preventive healthcare resources effectively."
Customer Feeling **What is the customer feeling?**	Frustrated by complex data, overwhelmed by static spreadsheets, and anxious about missing critical early warning signs in patients.	Empowered, relieved, and engaged as real-time filtering turns dense data into clear interactive visual insights.	Confident, proactive, and satisfied with improved clinical decision-making capabilities and enhanced patient health outcomes.
Process Ownership **Who is in the lead on this?**	Data Engineering / EHR Management Team & Healthcare Data Analyst (Emily Rodriguez).	Healthcare Data Analyst (Emily Rodriguez) & Clinical Risk Assessment Officer (Dr. Michael Carter).	Clinical Risk Assessment Officer (Dr. Michael Carter) & Public Health Researcher (Dr. Priya Nair).

Opportunities **How can we improve this stage?**	Automate data extraction, clean missing patient values, and establish standardized data integration pipelines for immediate analysis.	Incorporate automated dynamic risk alerts, predictive machine learning scores, and drill-down filters for underlying co-morbidities.	Integrate automated EHR export tools to push Tableau high-risk flags directly into patient medical charts for real-time clinical action.
